PROFESSIONAL SUMMARY

Self-taught analyst and software engineer with 5+ years translating complex business rules into maintainable systems, in resource-constrained contexts. Specialized in .NET backend with Clean Architecture (hexagonal, ports and adapters) and Domain-Driven Design. What sets me apart isn't the stack, it's the process: I understand the domain before writing code. Founder of GraphT, a SaaS productivity product designed, built, and launched end to end (backend, frontend, and infrastructure), where I defined the architecture standards and direct AI agents without sacrificing design quality.

Experienced in backend development, legacy system migration, industrial monitoring, database restructuring, infrastructure administration, and technical analysis of business processes.

PROFESSIONAL EXPERIENCE

GraphT Tlaxcala, Mexico · Remote

Founder · Full-Stack Development (Independent) August 2023 – Present

- Designed, built, and launched an end-to-end SaaS productivity product (public beta, October 2026).
- Backend in ASP.NET Core with Clean Architecture: pure domain model, use cases returning domain results instead of exceptions, one port per operation with persistence adapters, and a central error catalog mapped to HTTP codes.
- Neo4j graph database to model relationships between tasks; a Notion-style advanced filtering engine (nested rule groups, filters over task relationships and relative dates) independent of the database and translated to Cypher only in the adapter.
- Frontend with the same clean architecture: domain and use cases independent of the framework, HTTP adapters as the only boundary with the backend, a dependency injection container, and a UI organized with Feature-Sliced Design (React Router with SSR).
- Real-time notifications with the Outbox pattern + background worker + SignalR, and push notifications in the PWA (including iOS).
- Custom design system (tokens, 8px grid, mobile-first responsive from 320px) and internationalization in Spanish and English.
- Defined the project's architecture standards and code rules and used them as context to steer AI agents, producing generated code that respects the layers, patterns, and style.
- Business logic covered by unit tests (xUnit and NSubstitute on the backend, Vitest on the frontend) and self-hosted infrastructure with CI/CD and Cloudflare Tunnel.

Technologies: C#, ASP.NET Core, Clean Architecture, DDD, Neo4j (Cypher), React, React Router (SSR), TypeScript, SignalR, PWA, xUnit, NSubstitute, Vitest, Docker, CI/CD, Cloudflare Tunnel.

Independent work Tlaxcala, Mexico

Software Engineer · System migration (client: Industrial Complements) September 2026 – Present

- Migration of the internal system (Excel/VBA → .NET 8), contracted by module: short phases, each delivered and billed separately, with the old system running uninterrupted.
- .NET 8 backend with Clean Architecture and EF Core over SQL Server; React frontend. The domain is modeled from the business, not from the legacy tables.
- Data migration through the use cases: each record either enters or returns a domain error explaining why; the legacy stays frozen as the single source of contrast.
- Accounts module delivered and in use by the client; Inventory in progress.
- I define the domain, the architecture, and the judgment; AI agents implement under written rules.

Technologies: C#, .NET 8, ASP.NET Core, Clean Architecture, DDD, Entity Framework Core, SQL Server, React, shadcn, xUnit, Vitest.

Industrial Complements — Tlaxcala, Mexico

Backend Developer / Systems Developer — June 2023 – Present

- Maintain and extend the company's internal system (inventory, invoicing, and warehouse control), including the billing and tax rules I modeled in analysis sessions with the owner, still in use and under maintenance years later.
- Built a REST API in ASP.NET Core and Entity Framework Core to synchronize products, prices, and inventory across branches and integrate them with Tiendanube (JWT, Swagger, DTOs, and endpoint testing with Postman).
- Migrated and normalized legacy data from Excel/VBA sheets into relational structures in SQL Server using EF Core Code First.
- Applied Clean Architecture principles (domain model, use cases, dependency injection, and repository abstractions) in the internal .NET work.
- Participated in business analysis sessions to translate operational workflows into technical requirements.
- Coordinated and reviewed the technical work of university interns (code reviews and Git).
- Worked with Dockerized environments and self-hosted Linux services.

Technologies: C#, ASP.NET Core, Entity Framework Core, SQL Server, Docker, Neo4j, JWT, Swagger, GitHub, VBA, Tiendanube API.

Dalton — Mexico

Manual QA — March 2022 – June 2023

- Executed manual tests on web applications and backend services in staging environments.
- Designed and executed functional and UI-oriented test cases.
- Reported bugs and test results using Azure DevOps and Azure Test Plans.
- Collaborated with developers and Scrum roles during validation cycles.
- Studied QA methodologies, Gherkin syntax, and test automation concepts.

Technologies: Azure DevOps, Azure Test Plans, Manual QA, Web Testing.

Industrial Complements — Tlaxcala, Mexico

Desktop Developer / Inventory Systems — June 2021 – March 2022

- Built a desktop application (WPF, .NET 5, EF Core, MVVM) for warehouse and inventory, as a migration of the Excel/VBA workbook; the module reached production use.

- Implemented persistence with SQL Server and modeled the product, inventory, and warehouse-movement entities using EF Core Code First.
- Set up and administered the Linux NAS infrastructure (Ubuntu Server, Samba) used by the business.
- Coordinated and reviewed the technical work of a high-school intern.

Technologies: C#, .NET 5, WPF, MVVM, Entity Framework Core, SQL Server, Ubuntu Server, Samba.

Algoritmos Inteligentes — Mexico

Software Developer — August 2020 – April 2021

- Participated in the development of an industrial IoT platform for monitoring textile machinery.
- Developed Android and desktop applications connected in real time with Firebase Realtime Database.
- Implemented mobile notifications using Firebase Cloud Messaging.
- Built prototypes of dashboards and industrial data visualization.
- Participated in Scrum-based technical planning and requirements analysis with clients.
- Collaborated on the installation and maintenance of embedded Linux devices in industrial environments.
- Participated in the configuration of Linux NAS infrastructure and Samba networks.

Technologies: Android (Java), WinForms, Firebase Realtime Database, Firebase Cloud Messaging, Python, SQLite, Ubuntu Server, Samba.

EDUCATION

Colegio de Estudios Científicos y Tecnológicos del Estado, Plantel #10 — Tlaxcala, Mexico

Technical Baccalaureate — Programming Technician — August 2015 – June 2018

TECHNICAL SKILLS

Backend: C#, ASP.NET Core, REST APIs, Entity Framework Core, SignalR, JWT Authentication, Background Services, Dependency Injection.

Architecture & Design: Clean Architecture, Domain-Driven Design (DDD), CQRS, SOLID Principles, Repository Pattern, Ports & Adapters, use-case-oriented design.

Infrastructure & DevOps: Docker, Docker Compose, Linux, Ubuntu Server, CI/CD, Cloudflare Tunnel, Nginx Proxy Manager, Samba, self-hosted services.

Frontend: React, React Router (SSR), TypeScript, Feature-Sliced Design, PWA, token-based design systems, mobile-first responsive, Vitest.

Databases: SQL Server, Neo4j, Firebase Realtime Database, SQLite, relational data normalization, query modeling.

Additional Technologies: Git & GitHub, Azure DevOps, Android Development (Java), VBA, Firebase Cloud Messaging, TradingView Pine Script.

LANGUAGES

Spanish — Native · **English** — B2 conversational, C1 reading and writing

TECHNICAL INTERESTS

System design · Backend architecture · Domain modeling · Knowledge management systems · Self-hosted infrastructure · User-centered productivity systems
